Based on our survey on routing protocols of VANET, we found that few challenges and open research issues exist in routing of VANETs which is the most important area for research today. These open issues and challenges in VANET routing such as driver's behaviour, loss of signal, interferences caused by tunnels and high buildings [5, 6] have been discussed in this section.

In vehicle routing problems (VRPs) the decisions to be taken concern the assignment of customers to vehicles and the sequencing of the customers assigned to each vehicle. Additional decisions may need to be jointly taken, depending on the specific problem setting. In this paper, after discussing the different kinds of decisions taken in different classes of VRPs, the class where the decision ...

One of the major issues for routing in MANETs is the constant movement of nodes or node mobility. Disruption and frequent path breaks occur due to the movement of intermediate nodes in the path and end nodes. Efficient mobility management for dynamic MANETs should be an important feature for routing protocols in MANETs.

Routing Issues in Mobile Ad Hoc Networks: A Survey

One of the major challenges in a MANET, is to design the robust routing algorithms. Routing is an essential and major concern for effective and reliable communication between mobile nodes in a MANET. We present a survey of the main types of routing protocols and some security related issues of MANETs.

Abstract. This paper presents a survey of vehicle routing problems with multiple synchronization constraints. These problems exhibit, in addition to the usual task covering constraints, further synchronization requirements between the vehicles, concerning spatial, temporal, and load aspects. They constitute an emerging field in vehicle routing research and are becoming a “hot” topic.
