Many kinds of animals migrate, including bats, birds, large herbivores like caribou and elk, butterflies, fish, and marine mammals. Pacific salmon are born in freshwater streams and travel to the ocean to grow. When they reach adulthood, they travel back upstream (often up to 2,000 miles) to spawn. After overcoming obstacles like swift currents, fishing nets, and even waterfalls, they return to the exact spot where they hatched, lay their eggs, then die.

Animals on the Move - Fact Monster

Animal locomotion, in ethology, is any of a variety of methods that animals use to move from one place to another. Some modes of locomotion are (initially) self-propelled, e.g., running, swimming, jumping, flying, hopping, soaring and gliding.

Animal locomotion - Wikipedia

Birds aren't the only animals that migrate. Many animals are on the move in the spring and throughout the year. any insects also migrate. Monarch butterfliesleave New England in the late summer and head to their wintering home in the mountains of central Mexico.
