Bone marrow aspirate microscopic description (t-AML): Multiparticulate sample showing hypercellular marrow for the patient's age bone marrow (cellularity around 80%). Erythropoiesis is increased and shows prominent megaloblastoid changes; dysplastic changes in the form of multinucleation and nuclear bridging are seen.

Pathology Outlines - AML therapy related

Context.—Collagen vascular diseases are frequently included in the differential diagnosis for unexplained cytopenias and often prompt a bone marrow biopsy in this patient population to exclude malignancy. Few large-scale studies have characterized the bone marrow morphology in patients with collagen vascular disease, and most are limited to systemic lupus erythematosus or rheumatoid arthritis.
