A local-area network (LAN) is a computer network that spans a relatively small area. Most often, a LAN is confined to a single room, building or group of buildings, however, one LAN can be connected to other LANs over any distance via telephone lines and radio waves. A system of LANs connected in this way is called a wide-area network . The difference between a LAN and WAN is that the wide-area network spans a relatively large geographical area.

A local area network (LAN) is a collection of devices connected together in one physical location, such as a building, office, or home. A LAN can be small or large, ranging from a home network with one user to an enterprise network with thousands of users and devices in an office or school. Regardless of size, a LAN's single defining characteristic is that it connects devices that are in a single, limited area.

## LANs, WANs, and Other Area Networks Explained

Wireless LANs (WLANs) are wireless computer networks that use high-frequency radio waves instead of cables for connecting the devices within a limited area forming LAN (Local Area Network). Users connected by wireless LANs can move around within this limited area such as home, school, campus, office building, railway platform, etc.

LANs are typically confined within a small area—usually one building, but that's not a firm requirement. That area might be your home or small business, and it could contain just a few devices. It might also be a much larger area, like an entire office building that contains hundreds or thousands of devices.
