Data Warehousing In A Nutshell

Data warehousing is an essential concept to empower businesses to be able to report on key business information. Relational schemas do not support fast queries or the flexibility of being able to quickly slice and dice information by geography, time, product, and other important descriptive attributes.

ETL (or Extract, Transform, Load) is a process of data integration that encompasses three steps — extraction, transformation, and loading. In a nutshell, ETL systems take large volumes of raw data from multiple sources, converts it for analysis, and loads that data into your warehouse. Let's cover the three primary ETL steps.

ETL & Data Warehousing Explained: ETL Tool Basics | Xplenty

A data warehouse is a centralized repository of integrated data from one or more disparate sources. Data warehouses store current and historical data and are used for reporting and analysis of the data. To move data into a data warehouse, data is periodically extracted from various sources that contain important business information.

Data warehousing in Microsoft Azure - Azure Architecture ...

A data warehouse is a database of a different kind: an OLAP (online analytical processing) database. A data warehouse exists as a layer on top of another database or databases (usually OLTP databases). The data warehouse takes the data from all these databases and creates a layer optimized for and dedicated to analytics.

Database vs. Data Warehouse: A Comparative Review

Evolution in a nutshell: "BW on anyDB" "BW on HANA" "BW/4HANA" SaaS data warehouse: Leave the data where it is! What SAP does mean by "modern data warehousing" can be summarized in one sentence: "leave the data where it is!". At least, as much as possible. I am a firm supporter of this view.
