Parallel-flow and Counter-flow Heat Exchanger Heat exchangers are typically classified according to flow arrangement and type of construction. The simplest heat exchanger is one for which the hot and cold fluids move in the same or opposite directions. This heat exchanger consists of two concentric pipes of different diameters.

What is Parallel-flow and Counter-flow Heat Exchanger ...

Heat exchangers in which there is an intermittent flow of heat from hot to cold fluid via heat storage and heat rejection through the exchanger surface or matrix are referred to as indirect or storage type heat exchanger or regenerator. The regenerative type heat exchangers are either static or dynamic.

Heat Exchanger - Learn Mechanical Engineering

A counterflow heat exchanger has the hot fluid entering at one end of the heat exchanger flow path and the cold fluid entering at the other end of the flow path. Counter flow is the most common type of liquid-liquid heat exchanger, because it is the most efficient. A double pipe heat exchanger is usually operated as a counter flow heat exchanger, as shown in the diagram at the left.

Heat Exchanger Flow: Cross flow, Parallel flow, Counter ...

In recuperative type of heat exchangers, cold and hot fluid flow through the unit without mixing with each other. The transfer of heat occurs through the metal wall. Examples of recuperative heat exchangers are boilers, heaters, coolers, vaporizers, condensers etc. Regenerative type of heat exchangers same heating surface is alternately exposed to hot and cold fluid.

Heat Exchanger - Heat Transfer Coefficient - U-Factor

The volumetric flow rate in a heating system can be expressed as. $q = h / (c_p \rho dt)$ (1). where. q = volumetric flow rate (m^3/s). h = heat flow rate (kJ/s, kW). c_p = specific heat (kJ/kg °C). ρ = density (kg/m^3). dt = temperature difference (°C). This generic equation can be modified for the actual units - SI or imperial - and the liquids in use.

Heating Systems Flow Rates - Engineering ToolBox

The most common arrangements for flow paths within a heat exchanger are counter-flow and parallel flow. A counter-flow heat exchanger is one in which the direction of the flow of one of the working fluids is opposite to the direction to the flow of the other fluid.

Parallel and Counter Flow Designs Heat Exchangers ...

The classic example of a heat exchanger is found in an internal combustion engine in which a circulating fluid known as engine coolant flows through radiator coils and air flows past the coils, which cools the coolant and heats the incoming air.

Heat exchanger - Wikipedia

A shell and tube heat exchanger consists of several tubes enclosed in a shell. One fluid flows through the tubes while the other fluid is conducted through the shell. Flow through the shell and tubes can be countercurrent, cocurrent, or cross flow. In countercurrent flow, the shell fluid flows in the opposite direction of the tube fluid.

Fundamentals of Nuclear Engineering

Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy (heat) between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and

transfer of energy by phase changes.
