Form-Flex® couplings transmit torque while compensating for angular, parallel and axial misalignment between two connected shafts. Flexible disc couplings minimize the misalignment forces on the connected equipment. California Proposition 65 Warning: This product contains chemicals known to the State of California to cause cancer and/or birth defects or other reproductive harm.

Form-Flex® Flexible Disc Couplings | TB Wood's

This makes the coupling s exceptionally tolerant of relative displacements and enables control of torsional stiffness for the tuning of systems subject to torsional vibration. Flexible shafts, consisting of couplings, connected by fixed-length or telescopic centre shafts, will tolerate very large movements with minimal shaft reaction forces.

Sure-Flex Plus couplings utilize EPDM, Neoprene, and Hyltel™ flexible elastomer sleeves to transmit torque and accommodate shaft misalignment. Sure-Flex Plus couplings have exceptional torsional flexibility, with the 4-way flexing action absorbing virtually all types of shock, vibration, misalignment and end float. Sure-Flex Plus couplings are an

Flexible Couplings - TB Wood's

The flexible element absorbs the unavoidable torsional vibrations typically found in internal combustion engines and other reciprocating equipment. The ELASTOMERIC™ Coupling is available for both flywheel mounting and for assembly on stub shafts.

Elastomeric Couplings

Elastomeric flexible couplings join two shafts to transmit rotary motion from one shaft to another. They are made of elastic polymers that compensate for shaft misalignment and absorb the impact of shock and vibration. Elastomeric flexible couplings are available in a variety of types including tire and jaw. Tire couplings absorb heavy shock loads and prevent damage to shafts.

Elastomeric Flexible Couplings - Motion Industries

Advantages of layrub couplings. A particular advantage of the Layrub product is the ability it provides to engineer a coupling to suit the application. As well as being able to call upon a large range of standard couplings we are able to arrange the standard blocks into customised design and to tailor the characteristics to suit the application.

Metallic flexible couplings join two shafts together to transmit mechanical power. Their flexibility allows independent motion of the two shafts and compensates for shaft misalignment, while their metal construction allows couplings to withstand high temperatures and maintain correct alignment. Metallic flexible couplings include many types of couplings like disc shaft couplings and gear shaft couplings.

The Guard-Flex is a torsionally soft, vibration dampening coupling with an in shear design that will offer protection to both our engine and driven equipment when higher inertias are present. The Guard-Flex is a two piece design that incorporates straight, splined, and tapered shafts. Fits applications with a SAE 7.5 through SAE 11.5 flywheel, and is rated up to 82 HP.

Guard-Flex Flywheel Couplings | Guardian Couplings

A flexible coupling always allows, to varying degrees depending on type, structure and dimensions, displacements in four ways: axial, radial, conical and torsional. A stiffness defined for each of these cases. The stiffness affects the way in which the coupling reacts when subjected to each of the various possible displacements.
