Integral Test: If you can define f so that it is a continuous, positive, decreasing function from 1 to infinity (including 1) such that a[n]=f(n), then the sum will converge if and only if the integral of f from 1 to infinity converges.. Please note that this does not mean that the sum of the series is that same as the value of the integral. In most cases, the two will be quite different.

The first and simplest test is not a convergence test. Divergence test: If  $\lim_{n \rightarrow \infty} a_n \neq 0$  then the series  $\sum_{n=0}^{\infty} a_n$  does not exist, or exists and is nonzero, then  $\sum_{n=0}^{\infty} a_n = 1 \neq 0$  a n diverges. The proof is easy: if the series converges, the partial sums  $s_k = \sum_{n=0}^k a_n$  ...

Using series tests to determine convergence You may recall, from back when you first started studying integration, that you approximated the area under a curve by adding up a bunch of rectangles. You then made the width of the rectangles smaller and smaller, finding the limit of the area as the width went to zero, to find the area.

### Series, Convergence, and Series Tests

Definition of Convergence and Divergence in Series The  $n$ th partial sum of the series  $\sum_{k=0}^{\infty} a_k$  is given by  $S_n = a_0 + a_1 + a_2 + a_3 + \dots + a_n$ . If the sequence of these partial sums  $\{S_n\}$  converges to  $L$ , then the sum of the series converges to  $L$ . If  $\{S_n\}$  diverges, then the sum of the series diverges.

Another method which is able to test series convergence is the root test, which can be written in the following form:  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L$ . here  $a_n$  is the  $n$ -th series member, and convergence of the series determined by the value of  $L$  in the way similar to ratio test: if  $L < 1$  - series converged, if  $L > 1$  - series diverged. If  $L = 1$  - the ...

To use the limit comparison test we need to find a second series that we can determine the convergence of easily and has what we assume is the same convergence as the given series. On top of that we will need to choose the new series in such a way as to give us an easy limit to compute for  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n}$ .
